

Hackster.io Launches Project to Promote Gender Diversity in Hardware

Terms:

In a [2016 survey](#) [1] of people from 104 countries, Hackster.io discovered that fewer than six percent of hardware developers are women. In an effort to encourage more women of all ages to pursue careers in hardware, Adafruit and Hackster.io have collaborated to create the [Women in Hardware \(WiH\): Interview Series](#) [2].

Rather than focusing on the lack of diversity and difficult experiences that these women have faced, the video series is dedicated to calling attention to the amazing work being done today by some of the most inspiring and pioneering women in hardware who are inventing, innovating, and changing hardware for the better.

Click [here](#) [3] for more information on the WiH project and click [here](#) [4] to view the first interview in the series with CEO of littlebits Ayah Bdeir.
