Cautionary Statement

This presentation contains forward-looking statements made by Valero Energy Corporation ("VLO" or "Valero") within the meaning of federal securities laws. These statements discuss future expectations, contain projections of results of operations or of financial condition or state other forward-looking information. You can identify forward-looking statements by words such as "plan," "should," "anticipate," "believe," "estimate," "expect," "could," "continue," "focused," "opportunity," "scheduled," "may," "targeting," "guidance," "executing," "pursuing," "developing," "evaluating," "advancing," "would," or other similar expressions that convey the uncertainty of future events or outcomes. Forward-looking statements in this presentation include, but are not limited to, those relating to our low-carbon projects, statements relating our low-carbon fuels strategy, future capital expenditures, expected timing, cost and performance of projects, the effect of projects on our financial performance, future low-carbon policies and demand for low-carbon fuels, future business plans and strategies, future safety and environmental performance, future operating and financial performance, future market and industry conditions, future production and manufacturing ability and size, management of future risks and 2026 guidance, among others. These forward-looking statements are not guarantees of future performance and are subject to risks, uncertainties and other factors, some of which are beyond the control of Valero and are difficult to predict including, but not limited to, the effect, impact, potential duration or other implications of, global geopolitical and other conflicts and tensions, the impact of inflation on margins and costs, economic activity levels, market dynamics, cyberattacks, weather events, other matters affecting Valero's operations, financial performance or the demand for Valero's products, and the uncertainties that remain with respect to current or contemplated legal, political or regulatory developments that are adverse to or restrict refining and marketing operations, or that impose profits, windfall or margin taxes or penalties, and the adverse effects the foregoing may have on Valero's business plan, strategy, operations and financial performance. These statements are often based upon various assumptions, many of which are based, in turn, upon further assumptions, including examination of historical operating trends made by the management of Valero. Although Valero believes that the assumptions were reasonable when made, because assumptions are inherently subject to significant uncertainties and contingencies, which are difficult or impossible to predict and are beyond its control, Valero cannot give assurance that it will achieve or accomplish its expectations, beliefs or intentions. When considering these forward-looking statements, you should keep in mind the risk factors and other cautionary statements contained in Valero's filings with the Securities and Exchange Commission, including Valero's annual report on Form 10-K, quarterly reports on Form 10-Q, and other reports available on Valero's website at www.valero.com. These risks could cause the actual results of Valero to differ materially from those contained in any forward-looking statement.

This presentation includes certain financial measures that are not defined under U.S. Generally Accepted Accounting Principles (GAAP) and are considered to be non-GAAP measures. Valero has defined these non-GAAP measures and believes they are useful to the external users of its financial statements, including industry analysts, investors, lenders, and rating agencies. Valero believes these measures are useful to assess its ongoing financial performance because, when reconciled to their most comparable U.S. GAAP measures, they provide improved comparability between periods after adjusting for certain items that Valero believes are not indicative of its core operating performance and that may obscure its underlying business results and trends. These non-GAAP measures should not be considered as alternatives to their most comparable U.S. GAAP measures nor should they be considered in isolation or as a substitute for an analysis of Valero's results of operations as reported under U.S. GAAP. In addition, these non-GAAP measures may not be comparable to similarly titled measures used by other companies because Valero may define them differently, which diminishes their utility. Valero's reconciliations of GAAP financial measures to non-GAAP financial measures are located at the end of this presentation. See slides 41-43 for notes and slides 44-59 for non-GAAP disclosures.

REFINING

WORLD'S PREMIER INDEPENDENT REFINER

LEADING PROFITABLE PRODUCER OF LOW-CARBON TRANSPORTATION FUELS

RENEWABLE DIESEL

DIVERSIFYING INTO HIGHER GROWTH, HIGHER MARGIN SAF

ETHANOL

DEVELOPING PROJECTS TO CREATE A HIGHER VALUE ETHANOL PRODUCT

GROWTH PROJECTS FOCUSED ON COST CONTROL, OPTIMIZATION AND MARGIN EXPANSION

14 lowest cost refineries producer

3.0 million barrels per day of high-complexity throughput capacity

advantaged refining and logistics assets well positioned for feedstock and product optimization

rateable wholesale supply of >1.5 million barrels per day or over 50% of our light products

PREMIER REFINING PORTFOLIO INDEPENDENTLY FOUND TO BE RESILIENT EVEN IN A CARBON-CONSTRAINED SCENARIO⁽¹⁾

PROFITABLE, HIGH RETURN PROJECTS TARGETING GROWING LOW-CARBON MARKETS

DIAMOND GREEN DIESEL (DGD)

up to **1.2** billion gallons per year of liquid renewable fuels

up to **235** million gallons per year of SAF

low-carbon intensity renewable products produced primarily from recycled animal fats, used cooking oil, and inedible corn oil

up to **80%** reduction in life cycle GHG emissions

SUSTAINABLE AVIATION FUEL (SAF) PROJECT COMPLETED IN 4Q 2024

DEVELOPING ECONOMIC PROJECTS TO FURTHER REDUCE CARBON INTENSITY

12 ethanol plants

1.7 billion gallons per year production capacity

high-octane renewable fuel with lower CO₂ emissions

at least **30%** reduction in life cycle GHG emissions

existing logistics assets well positioned to support export growth

PURSUE REDUCTIONS IN CARBON INTENSITY THROUGH CARBON SEQUESTRATION

Best-in-class producer of fuels and products that are essential to modern life

Demonstrated commitment to capital discipline, innovation and unmatched execution

Operations

Unmatched Execution with a Proven History of Operations Excellence

- The lowest cash operating cost among peer group while maintaining top quartile operating performance
- Safe, reliable, environmentally responsible operations have driven higher profitability and lower volatility through multiple commodity cycles
- Applying our liquid fuels manufacturing expertise to optimize our integrated low-carbon fuels businesses

Earnings Growth

Growth Through Innovation

- Refining growth projects focused on operating cost control, optimization and margin improvement
- Leveraging our global liquid fuels platform to expand our long-term competitive advantage with investments in economic low-carbon projects
- 25% after-tax IRR hurdle rate for growth projects

Capital Discipline

Demonstrated Commitment to Stockholders

- Disciplined capital allocation delivering peer-leading free cash flow yield and returns to stockholders across margin cycles
- Delivered on our annual payout ratio commitment every year under current management (since 2014)
 - Average payout ratio of 70% since 2014 (59% excluding 2020)
 - Reduced our shares outstanding by approximately 42% since 2014
- 15% average annual Return on Invested Capital (ROIC) since 2014

Comprehensive liquid fuels strategy underpinned by excellence in operations, disciplined capital allocation and a commitment to shareholder returns

Steadfast in the execution of our strategy, pursuing **excellence in operations**, investing for **earnings growth with lower volatility** and honoring our **commitment to stockholder returns**

SIZE, SCALE AND GLOBAL REACH

EXTENSIVE CONNECTIVITY AND GLOBAL OPTIMIZATION

LOWEST COST PRODUCER

RELIABLE TOP QUARTILE OPERATIONS

DISCIPLINED INVESTMENTS

GROWTH WITH LOWER VOLATILITY

PREMIER REFINING PORTFOLIO

INDEPENDENTLY FOUND TO BE RESILIENT EVEN IN A CARBON-CONSTRAINED SCENARIO⁽¹⁾

SIZE, SCALE AND GLOBAL REACH

high complexity coastal system with **extensive connectivity** to inland and imported crudes

operational flexibility to process a wide range of feedstocks

ratable wholesale supply of >1.5 million barrels per day or over 50% of our light products

global operations support **optimization** of product exports
one of the largest light products importers into Mexico

LOWEST COST PRODUCER WHILE ACHIEVING RELIABLE TOP QUARTILE OPERATIONS

safety and **reliability** are imperative for profitability

2025 was our **best year ever** for **Employee and Contractor Safety, Environmental Performance and Mechanical Availability**

access to cheap natural gas and a deep pool of skilled labor in the U.S. Gulf Coast

INVESTMENTS IN EFFICIENCY, MARKET EXPANSION AND HIGHER MARGIN CAPTURE

reducing cost and improving margin capture

- Wilmington and Pembroke cogens
- St. Charles and Port Arthur hydrocrackers
- Port Arthur coker
- Houston and St. Charles alkylation units

improving feedstock flexibility, cost and crude quality

- Diamond, Sunrise and Red River pipelines
- Connectivity in Corpus Christi
- Line 9 into Quebec
- Houston and Corpus Christi toppers

growing market share into higher netback markets

- Central Texas pipelines and terminals
- Pasadena terminal
- Expansion into Latin America with investments in Mexico and Peru

Select Refining Optimization and Strategic Growth Projects

(\$ in millions)

Optimization and Strategic Projects (in-service date)	Project Description	Annual EBITDA Estimate (at FID)
Large Capital Projects (≥\$300, >25% unlevered after-tax IRR at FID)		
Port Arthur Coker (2Q23)	See slide 26	\$325
St. Charles Alky (4Q20)	See slide 27	\$150
Houston Alky (4Q19)	See slide 27	\$100
Small Capital Projects (≤\$50, 30% to 65% unlevered after-tax IRR at FID)		
Texas City Crude Flexibility (1Q17)	See slide 41	\$30
Port Arthur Butane Rail Rack (3Q17)	See slide 41	\$10
St. Charles Gasoline Blender (2Q17)	See slide 41	\$15

Leadership in low-carbon renewable fuels underpinned by high economic returns

DGD Renewable Fuels Capacity

(million gallons per year)

Renewable Diesel Realized Cash Flow Profile

(\$ in millions)

Expanding our competitive advantage with sustainable aviation fuel (SAF)

DGD Port Arthur SAF Project

- **Large-scale SAF project** at the DGD Port Arthur plant was completed in the fourth quarter of 2024
 - The plant has the capability to upgrade up to 50% of its current renewable diesel production capacity to SAF, or ~**235 million gallons per year**
 - The project **cost was \$315 million**, with half of that attributable to Valero
 - Project included a heater, a fractionation unit to separate the SAF and renewable diesel product streams, and additional product tankage
- Project is expected to **exceed our minimum return threshold** of an after-tax IRR of 25%
 - SAF supports airlines' compliance with **global mandates** and reduces their offset obligations

Ethanol segment leverages low-cost operations and scale to capture margin upside

Operations

- 12 plants with **1.7 billion gallons** annual production capacity
 - **Efficient plants with scale**, located in the corn belt
 - Operational best practices transferred from refining
 - Increasing production of lower carbon intensity **fiber cellulosic ethanol**
- **Cost advantaged** versus the industry

Strong free cash flow profile under VLO ownership

Outlook

- Ethanol will remain a significant part of the **global fuel mix**
- Global renewable fuel mandates should drive **export growth**, such as Canada's new CFR regulation
- Carbon reduction programs providing **economic incentives**:
 - **45Q Tax Credit** provides economic incentive for CO₂ sequestration
 - **LCFS and D3 RINS** provide higher value for the **lower carbon intensity ethanol**
 - Operational efficiency allows capture of **45Z Tax Credit** through 2029

U.S. Fuel Ethanol Exports (mbpd)

Disciplined capital allocation is a constant in our strategy

1 Maintain a Strong Balance Sheet

Maintain an investment grade credit rating

Target 20% to 30% net debt-to-cap ratio

2 Non-discretionary

Sustaining Capex

- Targeting approximately \$1.4 billion in 2026
- Key to safe and reliable operations

Dividend

- Commitment to stockholders
- Targeting a sustainable and growing dividend with a dividend yield that is at the high end of our peer group

3 Discretionary

Growth Capex

- 25% after-tax IRR hurdle rate for projects
- Refining projects focused on operating cost control, market expansion and margin improvement
- Economic low-carbon fuels expansion

Acquisitions

- Evaluate versus alternative uses of cash

Share Repurchases

- Commitment to a through-cycle minimum annual payout ratio of 40% to 50% of adjusted net cash provided by operating activities
- Share repurchase program consists of ratable and opportunistic purchases

Steady investments to maintain our asset base and enhance the margin capability of our portfolio

Growth capital investments underpinned by a 25% unlevered after-tax IRR hurdle rate

Annual Capital Investments Attributable to Valero

(\$ in billions)

Sustaining Capex as a percentage of Depreciation and Amortization

Sustaining capital investments includes costs for turnarounds and catalysts and projects to comply with regulatory compliance. Growth capital investments includes joint-venture investments but excludes acquisitions. Sustaining and growth excludes 50% of DGD's sustaining and growth capex attributable to the other joint venture member and those related to other variable interest entities. See slides 44-59 for non-GAAP disclosures. Totals may not sum due to rounding.

- Executing **FCC Optimization** project at St. Charles
- Completed **Port Arthur Coker**
- Completed **Alkylation Units** at St. Charles & Houston
- Completed **Topping Capacity** at Corpus Christi & Houston
- Completed **Hydrocracking Units** at St. Charles & Port Arthur
- Completed **Renewable Diesel** production
- Completed **Sustainable Aviation Fuel (SAF)**

Delivering on our commitment of cash returns to stockholders

Stockholder Returns⁽¹⁾ (\$ in billions)

Payout Ratio⁽¹⁾

Delivering cash returns through sustainable dividend growth and discretionary share repurchases

Shares Outstanding (in millions)

Global scale with concentration in advantaged U.S. Gulf Coast

2.5 mmbpd Refining Capacity

(mbpd, % of overall crude capacity)

Gulf Coast Refining Capacity⁽¹⁾

(mbpd, % of overall crude capacity)

⁽¹⁾ CDU capacity from EIA data and company reports. See slide 34 for Valero's capacity and Nelson complexity by refinery.

Crude supply advantage in the U.S. Gulf Coast and Mid-Continent

Taking advantage of Permian crude with investments in Corpus Christi

Valero U.S. Gulf Coast Feedstock Ranges
(quarterly averages)

Valero's refineries have operational flexibility to **process a wide range of feedstocks**, along with access to a deep pool of **skilled labor** on the U.S. Gulf Coast

Source: VLO quarterly data from 2012 through 2025. See slides 41-43 for notes regarding this slide.

Operational flexibility and refinery optimization provide competitive advantage

- VLO has demonstrated a wider range of yields for gasoline, kerosene, jet fuel, and diesel versus the industry
- Our operational flexibility and optimization enable a rapid shift in light product yields from “max gasoline” to “max distillate” as market conditions change, supporting higher margin capture
- Flexibility, along with operational reliability, provides a competitive advantage during periods of volatility

Growing a ratable global wholesale supply business through an extensive marketing network

Valero's Global Wholesale Volumes

(% of total light products production, mbpd)

>1.5 million barrels per day of ratable wholesale supply

>50% of our light products production

BEACON

~7,000 outlets carry our brand names

(1) U.S. volumes exclude jet rack sales.

(2) Europe and Canada volumes include jet fuel.

(3) Peru volumes include jet fuel.

Stable branded and unbranded demand

Rack blending partially offsets our RVO compliance costs

Mexico wholesale business supported by a growing, flexible logistics supply system

Competitive global light products supply

Source: Industry consultants.

See slides 41-43 for notes regarding this slide. Totals may not sum due to rounding.

Product shortages in Latin America, Eastern Canada, Europe, and Africa expected to drive U.S. export demand growth

Investing to grow product exports into higher netback markets

Advantaged Refineries and Logistics

⁽¹⁾ Reflects Valero's current and anticipated future terminals (owned or leased).

U.S. Product Exports

(12-month moving average, mbpd)

Expansion of supply chain to high demand growth markets **provides a ratable product outlet** and **improves margin capture**

Investing to improve access to North American crude and lower refinery operating cost structure

GROWTH PROJECTS FOCUSED ON OPTIMIZATION AND MARGIN CAPTURE

Completed **Diamond Pipeline** project with 200 MBPD capacity **connecting Memphis to Cushing** and **Sunrise Pipeline** 100 MBPD undivided interest **connecting Midland to Wichita Falls**

Provides **additional Mid-Continent crude access** to our McKee, Ardmore and Memphis refineries

Improves crude oil **supply flexibility, efficiency and blend quality**

Red River Pipeline 74 MBPD undivided interest **connecting Ardmore to Cushing**

Provides **additional Mid-Continent crude flexibility** to the Ardmore refinery

Navigator **Glass Mountain Pipeline Connection** with 50 MBPD capacity **connecting McKee to Cushing**

Reversal and extension in-service 2021

Provides **Mid-Continent crude flexibility and security of supply** to the McKee refinery

GROWTH PROJECTS FOCUSED ON COST CONTROL AND MARGIN EXPANSION

Wilmington cogeneration (\$110 MM cost) unit started up in 2017

Pembroke cogeneration unit (\$170 MM cost) started up in 2021

Expect to **reduce costs and improve supply reliability** for power and steam

Diamond Pipeline

Wilmington Cogeneration Plant

Investing to improve margins and light product yields

Port Arthur Coker

- **55 MBPD delayed coker and sulfur recovery unit** started up in the second quarter of 2023
- Creates two independent CDU-VDU-coker trains, designed to **improve turnaround efficiency** and **reduce maintenance-related lost margin opportunity**
- Design enables **full utilization of existing CDU** capacity, **reduces VGO purchases**, **increases heavy sour crude and resid processing capability**, and **increases diesel** product yield
- Estimated **\$325 MM annual EBITDA contribution** at FID mid-cycle prices

Project provides additional crude flexibility

Incremental Feedstock & Product Ranges (MBPD)	
Feedstocks	
	Ranges
Crude Oil	50 – 100
Coker Feed (Resid)	20
VGO	(30) – (50)
Products	
LPG	1 – 4
Naphtha	0 – 3
Gasoline	0 – 15
Diesel	25 – 45

Investing to upgrade product value

Houston and St. Charles Alkylation Units

- **Octane demand expected to grow** due to Tier 3 sulfur regulations and CAFE standards
- Abundant, low cost North American NGL supply provides advantage for Gulf Coast capacity additions
- Both units **upgrade low value isobutane and amylenes into high value alkylate**
 - High octane, low vapor pressure component enables the blending of incremental butane and low octane naphtha

Capacity at Houston refinery
(\$300 MM cost) started up in 2019

Capacity at St. Charles refinery
(\$400 MM cost) started up in 2020

Houston Alkylation Unit

Investing to supply higher demand markets and expand product export and biofuels blending capabilities

Central Texas pipelines and terminals to supply high-growth refined products market

- Started up in 2019
- Approximately 205 miles of pipe⁽¹⁾, 960,000 barrels of total storage capacity and a truck rack

Pasadena refined products terminal joint venture

- Completed in 2020
- **5 MM barrels of storage capacity** with butane blending, two ship docks and a three-bay truck rack

Projects **improve product margins**, reduce secondary costs, provide opportunity for third-party revenues, and increase capability for biofuels blending

Extending product supply chain in **Central Texas** and the **U.S. Gulf Coast**

U.S. natural gas provides operating expense and feedstock cost advantages for U.S. Refiners

Reliability and safety are imperative for profitability

2025 was our **best year ever** for **Employee and Contractor Safety, Environmental Performance** and **Mechanical Availability**

Personnel Safety

Tier 1 Process Safety (Annual)

Reliable refinery operations reflected in Valero's strong **Mechanical Availability** record

Investments in reliability have contributed to operations excellence

Global low-carbon fuel policies driving demand growth for renewable diesel

	2030 GHG Emissions Reduction Target	Net-zero GHG Emissions Target	Primary Transportation Fuel Policy Mechanism	2030 Transportation Fuels Goal
California	40%	Net-zero by 2045	Low Carbon Fuel Standard (LCFS)	Reduce the carbon intensity of transportation fuels by at least 30%
Canada	40 to 45%	Net-zero by 2050	Clean Fuel Regulations (CFR)	Reduce the carbon intensity of transportation fuels by 15%
EU	55%	Net-zero by 2050	Renewable Energy Directive III (RED III)	Replace 29% of transport fuels with renewable energy, or reduce sector GHG intensity by 14.5%
UK	68%	Net-zero by 2050	Renewable Transport Fuel Obligation (RTFO)	Replace 19% of transport fuels with renewable fuels
Oregon	Clean Fuels Program requires a 20% carbon intensity reduction by 2030 and a 37% reduction by 2035			
New Mexico	Clean Transportation Fuel Standard, targeting a 20% carbon intensity reduction by 2030			
Washington State	Clean Fuel Standard requires a 45% carbon intensity reduction by 2038 (may be as high as 55% if certain conditions met)			
British Columbia	Low Carbon Fuel Standard requires a 30% carbon intensity reduction by 2030			
Norway	Biofuel for road transport mandated at 20% in 2026 and 21% in 2027			
U.S. Federal Policies	Renewable diesel demand is also driven by the EPA’s Renewable Fuel Standard (RFS) and the IRS Production Tax Credits (PTC) included in the One Big Beautiful Bill (OBBB)			

Up to 80% reduction in life cycle GHG emissions

Cost-effective fuel that can be used with existing vehicles

Drop-in fuel that does not require infrastructure investments

Source: DOE, agency websites, industry consultants and Valero estimates.
⁽¹⁾ 2024 diesel demand, inclusive of biofuels, and Renewable Diesel (RD) and Biodiesel (BD) consumption in Canada, EU, UK, and U.S. states with mandates in place (CA, OR, WA, and NM).

SAF mandates are expanding globally

	SAF Mandates
CORSIA	Program aims to offset growth in CO ₂ emissions from international aviation above 85% of 2019 emissions. Participation is voluntary over 2021-2026 and becomes mandatory for participating nations starting in 2027 ⁽¹⁾
EU⁽²⁾	2% in 2025, 6% in 2030, 20% in 2035, 34% in 2040, 42% in 2045, and 70% in 2050
France⁽³⁾	1.5% in 2024, 2% in 2025 and 5% in 2030
Sweden⁽³⁾	1% in 2021 and increasing to 30% in 2030
Switzerland	2% in 2026 and increasing to 6% by 2030
Norway	2% in 2026, expected to increase to 30% in 2030
UK	2% in 2025, increasing linearly to 10% in 2030 and then to 22% in 2040
British Columbia	1% in 2028, 2% in 2029 and 3% in 2030
Brazil	GHG emission reduction of 1% in 2027, progressively increasing to 10% by 2037, through the use of SAF
India	Target of 1% by 2027, 2% by 2028, and 5% by 2030
Japan	10% by 2030
Singapore	1% in 2026, possibly increasing to 3%-5% in 2030
South Korea	1% in 2027, increasing to 3-5% in 2030 and 7-10% in 2035
Thailand	1% in 2026, increasing to 1-2% over 2027-29, 3-5% over 2030-32, and 5-8% over 2033-37
Potential Policies	Indonesia, Malaysia, Iceland ⁽²⁾ , Liechtenstein ⁽²⁾ , and Netherlands ⁽³⁾

⁽¹⁾ Currently 130 nations voluntarily participate

U.S. West Coast	135	85	15.8
Total	3,020	2,520	11.5⁽³⁾

⁽¹⁾ Capacities and Nelson complexity indices as of December 31, 2025 and excludes Valero's Benicia Refinery, where processing units were idled in April 2026.

⁽²⁾ Represents the combined capacities of two refineries—Corpus Christi East and Corpus Christi West.

⁽³⁾ Weighted average.

Majority of refineries designated as **VPP Star Sites** by OSHA, recognizing exemplary occupational safety, process safety and health programs

Valero's logistics assets

- **Over 3,000 miles of active pipelines**
- Central Texas Pipeline started up in 2019
- Sunrise Pipeline expansion started up in 2018
- **Over 130 million barrels** of active **shell capacity** for crude oil and products
- **Over 200 truck** rack **bays**
- Pasadena terminal completed in 2020
- **Approximately 5,200 railcars**
- Expected to serve long-term needs of ethanol, asphalt, aromatics, and other products
- **Over 50 docks**
- **Two Panamax class vessels** (joint venture)

Comprehensive roadmap to further reduce emissions with innovative projects consistent with our strategy

GHG Emissions Reduction and Displacement (Global Refinery Scope 1 & 2)

2035 GHG Emissions Target (Global Refinery Scope 1 & 2) *Independently Verified*

In 2024, our performance exceeded our **2025 target** to **reduce** and **displace the equivalent of**

63% of the tonnage from our Refinery GHG Emissions (Scope 1 & 2)

In 2025, we obtained **limited assurance** on/of:

- Company-wide 2024 GHG emissions (Scopes 1 & 2); 2024 displacements from low-carbon fuels
- The validation of our 2035 GHG emissions target
- Refinery 2024 Scope 1 intensity (per barrel)
- Company-wide 2024 use of products GHG emissions intensities

A commitment to environmental excellence, beyond regulations

E

ENVIRONMENTAL

Reducing, Reusing, Recycling, and Repurposing

Carbon Capture

Refining

Flare-gas recovery systems resulted in **more than 97% flaring-free** operations in 2025

Real-time air quality screenings are conducted at several **refineries** and **fenceline communities**

Refinery energy intensity has **declined by more than 12.5%** since 2012 with capital investments, including **flare-gas recovery and other efficiency projects**

Our Port Arthur refinery became **the first industrial site** in the U.S. to **host a large scale carbon capture project** in 2013, with **more than 1 million metric tons captured each year**

Low-carbon Fuels

Renewable diesel **reduces life cycle GHG emissions up to 80%**⁽¹⁾⁽²⁾

A drop-in fuel, renewable diesel is primarily produced from **used cooking oil, animal fats** and **inedible corn oil**

High-octane, low-carbon ethanol reduces **life cycle GHG emissions by at least 30%**⁽²⁾

Cellulosic ethanol: Using **enzymes to convert fiber** into fuel further reduces carbon intensity to **high 20s**

Developing **stand-alone CCS** projects **at certain of our Eastern ethanol plants**. Continue participating as a potential shipper on third-party proposed **CCS pipelines**

The 2025 Valero Guiding Principles Report includes **GHG emissions targets and disclosures**

See details at [Valero.com](https://www.valero.com) > Investors > Governance & Engagement

Sharing our success with the communities where we operate with strong governance and ethical standards

A vehicle running on renewable diesel emits fewer emissions than an electric vehicle

RENEWABLE DIESEL
A DROP-IN FUEL

U.S. Light-Duty Vehicle Life Cycle Emissions

2022 Southwest Research Institute Study

U.S. Heavy-Duty Long-Haul Vehicle Life Cycle Emissions

2022 Southwest Research Institute Study

A single light-duty vehicle running on renewable diesel emits **10 tons less CO₂ emissions** than an electric vehicle, an amount equal to planting **165 trees***

A single heavy-duty long-haul vehicle running on renewable diesel emits **858 tons less CO₂ emissions** than an electric vehicle, an amount equal to planting **14,187 trees***

*Estimated based on EPA's GHG Equivalencies calculator for urban tree seedlings grown for ten years.

Electric Vehicle (EV) myth: zero emissions

Fact: significant emissions from EV life cycle

- Life cycle emissions from EVs are significant from mining raw materials to fabrication to delivery to the showroom
 - Two times as much CO₂ emissions are generated compared to cars fueled by gasoline
 - Before it leaves the showroom, 12 tons of CO₂ emissions have already been generated vs. 6 tons of CO₂ emissions from cars fueled by gasoline
- 25 tons of CO₂ emissions are needed to make an EV that can drive a similar range as a car fueled by gasoline
- "The problem is that batteries are big and heavy. The more weight you're trying to move, the more batteries you need to power the vehicle. But the more batteries you use, the more weight you add—and the more power you need. Even with big breakthroughs in battery technology, electric vehicles will probably never be a practical solution for things like 18-wheelers, cargo ships, and passenger jets. Electricity works when you need to cover short distances, but we need a different solution for heavy, long-haul vehicles"* – GatesNotes
- Southwest Research Institute Ted Talk, presented by Graham Conway

Embedded CO₂ Emissions
(zero miles traveled)

Before it leaves the showroom, an EV emits twice the CO₂ emissions compared to a car fueled by gasoline

Notes

Payout Ratio

Payout Ratio is the sum of dividends, cash payments for purchases of common stock for treasury in the respective period, and a 1% excise tax associated with those purchases that commenced in 2023, divided by adjusted net cash provided by operating activities. Adjusted net cash provided by operating activities excludes changes in current assets and liabilities and 50% of DGD's net cash provided by operating activities (excluding changes in current assets and liabilities) attributable to the other joint venture member.

Light Products

Light products is the combined volume of gasoline and distillate. Gasoline volume includes blendstocks and distillate volume includes ULSD, jet fuel, kerosene, and ULSK.

Slides 5 and 16

Free cash flow is defined as net cash provided by operating activities less capital expenditures of VLO and DGD, deferred turnaround and catalyst cost expenditures, investments in joint ventures, and changes in current assets and liabilities. Average free cash flow reflects 2012 through the most recent annual filing. Average free cash flow as a percentage of market cap for PBF reflects years 2013 to 2025 due to its December 2012 IPO. Volatility expressed as coefficient of variance, or the standard deviation divided by the mean, of the respective metric on a quarterly basis from the first quarter of 2012 through the fourth quarter of 2025. EBITDA is net income (loss) before depreciation and amortization expense, "interest and debt expense, net of capitalized interest", income tax expense (benefit), and income (loss) from discontinued operations. Refining peer group includes PSX, MPC, DINO, and PBF. Oil majors include XOM, CVX, COP and EOG.

Slides 7 and 26

Amounts shown for annual EBITDA represent targeted or estimated EBITDA growth or contribution. Valero is unable to provide a reconciliation of such forward-looking measures because certain information needed to make a reasonable forward-looking estimate and reconciliation is difficult to estimate and dependent on future events, which are uncertain or outside of its control, including with respect to unknown financing terms, project timing and costs, and other potential future variables that are not known or reasonably estimable at this time. Accordingly, a reconciliation is not available without unreasonable effort. Such forward-looking non-GAAP measures are estimated consistent with the relevant definitions and assumptions.

Slide 7

Texas City Crude Flexibility: Upgraded crude receipt and tankage logistics to increase the number of crude segregations and allow import and processing of discounted crude oils.

Port Arthur Butane Rail Rack: Added railcar LPG loading and unloading rack, associated rail track, and LPG tankage at Port Arthur refinery to allow import of excess butane from some of our other refineries during summer months for storage at Fannett Wells and export of butane during the winter months. Import / export allows capture of seasonal arbitrage and avoids third party storage or sales.

St. Charles Gasoline Blender: Installed a state-of-the-art gasoline blend system with online analyzers for blend optimization. Project provides the capability to blend additional grades (RBOB and export grades) and minimizes gasoline quality (octane, RVP) giveaway.

Notes

Slide 9

DGD produces synthetic paraffinic kerosene (SPK), a renewable blending component, using the Hydrotreated Esters and Fatty Acids (HEFA) process. SPK is also commonly referred to as “SAF” or “neat SAF.” Current aviation regulations allow SPK to be blended up to 50% with conventional jet fuel for use in an aircraft. This blend is commonly referred to as “SAF” or “blended SAF.” This document refers to both SPK and blended SAF as SAF.

Slide 10

Average sustaining capex per gallon represents sustaining capital investments for the Ethanol segment divided by ethanol production volume for the period. Production volume is calculated by multiplying production volumes per day by the number of days in the applicable period.

Slide 12

Targeted net debt-to-cap ratio based on total debt reduced by balance sheet cash. Peer group includes PSX, MPC, DINO, and PBF. Payout ratio is the sum of dividends and cash payments for purchases of common stock for treasury and a 1% excise tax associated with those purchases that commenced in 2023 divided by adjusted net cash provided by operating activities. Adjusted net cash provided by operating activities excludes changes in current assets and liabilities and the portion of DGD’s operating cash flow (excluding the changes in its current assets and liabilities) attributable to the other joint venture member.

Slide 20

Ranges represent average quarterly minimums and maximums of each feedstock category as a % of total feedstock. Ranges for monthly averages are wider.

Slide 23

VLO U.S. product exports reflect Valero’s actual U.S. gasoline and distillate export volumes. Distillate volume includes diesel, jet fuel and ULSK. Map shows destinations for products exported from Valero’s refineries in the U.S., Canada and the U.K.

Slide 29

VLO Refining system used as a proxy for U.S. refining and compared to a European refinery with similar processing unit configuration. Platts Houston Ship Channel natural gas price quotes used for the U.S. and the ICE UK National Balancing Point quotes used for Europe. Historical natural gas price impact based on 2019 prices. VLO Refining natural gas consumption is ~900,000 MMBtu per day, of which 63% is operating expense and the balance is cost of materials.

Slide 30

Industry Total Recordable Incident Rate (TRIR) from U.S. Bureau of Labor Statistics. Tier 1 refining process safety events per 200,000 work hours. Tier 1 defined within API Recommended Practice 754.

Notes

Slide 33

California LCFS credit values are for 2026, assuming \$100 per metric ton carbon price. Renewable diesel peers reflect Neste, PSX, MPC, and DINO. Adjusted EBITDA per gallon for peers reflects reported financials.

Slides 36, 37, and 38

Valero’s 2025 Guiding Principles Report can be accessed on the Governance and Engagement page of the Valero’s investor relations website at [Investor.valero.com](https://investor.valero.com). Further detail on our GHG emissions reduction disclosures can be found on pages 16-29 of the 2025 Valero Guiding Principles Report. Flare-gas recovery systems are installed in 13 of our refineries. We track the percent time flaring for each flare with flare gas recovery and calculate an annual average across the refineries. Disclosures related to safety, low-carbon projects, environmental matters, community, people, compensation and governance can be found in the 2025 Valero Guiding Principles Report.

Slide 39

U.S. Light-Duty Vehicle (LDV) Life Cycle Emissions study conducted by Southwest Research Institute – “Life Cycle Analysis Report” (2022) based on simulations performed using the GREET life cycle analysis tool. LDV with 12 year life and 160,000 miles traveled, renewable diesel emissions are based on 100% waste oil based renewable diesel blend, electricity based on 2019 EIA average mix, and no battery replacement for 300 mile range electric vehicle. Vehicle class mix of 30% sedans, 20% crossovers, and 50% pickup/SUV trucks. Embedded emissions captures the emissions involved in the manufacturing, assembly, and production of the vehicle as well as maintenance items over the lifetime of the vehicle i.e. battery, fluids, ADR (assembly, disposal, and recycling), and components.

U.S. Heavy-Duty Long-Haul Vehicle (HDV) Life Cycle Emissions study conducted by Southwest Research Institute – “Life Cycle Analysis Report” (2022). Class 8 heavy-duty truck with a 1,000,000 mile (~15 years) lifetime, electric truck with a 500-mile battery range, electricity based on 2019 EIA average mix, one battery replacement, and diesel engine running on 100% waste oil based renewable diesel. Embedded emissions captures the emissions involved in the manufacturing, assembly, and production of the vehicle as well as maintenance items over the lifetime of the vehicle i.e. battery, fluids, ADR (assembly, disposal and recycling), and components.

Non-GAAP disclosures

Return on Invested Capital (ROIC)

VLO defines return on invested capital (ROIC) as adjusted net income (loss) attributable to VLO stockholders before adjusted net interest expense after-tax, divided by average adjusted invested capital. VLO defines adjusted net income attributable to VLO as net income (loss) attributable to VLO stockholders adjusted for the after-tax effect of special items attributable to VLO that VLO believes are not indicative of its core operating performance and may obscure underlying business results, trends and comparability between periods (see corresponding earnings release). VLO defines adjusted net interest expense as “interest and debt expense, net of capitalized interest” adjusted to exclude “interest and debt expense, net of capitalized interest” attributable to noncontrolling interests. The income tax effect of adjusted net interest expense is estimated based on the U.S. statutory income tax rate for the respective annual period. Average adjusted invested capital is defined as the average of total adjusted invested capital for the current and prior annual periods. VLO defines total adjusted invested capital as debt attributable to VLO, plus VLO stockholders’ equity less adjusted cash and cash equivalents. Debt attributable to VLO is defined as total debt and finance lease obligations less total debt and finance lease obligations attributable to consolidated VIEs. Debt attributable to VLO for the year ended December 31, 2014 includes an adjustment to reflect the retrospective adoption of ASU No. 2015-15 subtopic 835-30, which resulted in the reclassification of certain debt issuance costs from “deferred charges and other assets, net” to “debt and finance lease obligations, less current portion.” Adjusted cash and cash equivalents is defined as cash and cash equivalents adjusted to exclude cash and cash equivalents of consolidated VIEs. Debt and cash attributable to consolidated VIEs are excluded because amounts are only available to fund the operations of the VIEs and the creditors do not have recourse against VLO.

Free Cash Flow

VLO defines free cash flow as net cash provided by operating activities less capital expenditures of VLO and DGD, deferred turnaround and catalyst cost expenditures, investments in joint ventures, and changes in current assets and liabilities. VLO believes that the presentation of free cash flow provides useful information to investors in assessing VLO’s ability to cover ongoing costs and to generate cash returns to stockholders. The GAAP measures most directly comparable to free cash flow are net cash provided by operating activities and net cash used in investing activities.

Refining Segment Adjusted EBITDA per Barrel

Refining segment adjusted EBITDA is defined as Refining segment operating income (loss) excluding depreciation and amortization expense and the effect of items that VLO believes are not indicative of its core operating performance and that may obscure underlying business results, trends, and comparability between periods. Refining segment adjusted EBITDA per barrel is annual Refining segment adjusted EBITDA divided by refinery throughput volume for the period. Throughput volume is calculated by multiplying throughput volumes per day by the number of days in the applicable period.

Non-GAAP disclosures

Renewable Diesel Net Cumulative Cash Flow

VLO defines renewable diesel net cumulative cash flow as DGD's cumulative adjusted EBITDA attributable to VLO, less DGD's cumulative capital expenditures attributable to VLO. VLO is a 50% joint venture member in DGD and consolidates DGD's financial statements. VLO defines DGD's adjusted EBITDA attributable to VLO as DGD's operating income (loss) before depreciation and amortization expense, adjusted for the effect of items that VLO believes are not indicative of DGD's core operating performance and that may obscure underlying business results, trends, and comparability between periods and for the portion of adjusted EBITDA attributable to the other joint venture member. VLO defines DGD's capital investments attributable to VLO as DGD's capital investments adjusted for the portion of capital investments attributable to the other joint venture member. Because DGD's net cash flow is effectively attributable to each joint venture member, only VLO's portion of DGD's adjusted EBITDA and capital investments should be attributed to VLO's renewable diesel cash flow. Therefore, renewable diesel cash flow has been adjusted for the portion of DGD's adjusted EBITDA and capital investments attributable to VLO's joint venture member's ownership interest because VLO believes that it more accurately reflects cash flow generated by its renewable diesel segment.

Ethanol Segment Adjusted EBITDA per Gallon

Ethanol segment adjusted EBITDA is defined as Ethanol segment operating income (loss) excluding depreciation and amortization expense, adjusted for the effect of items that VLO believes are not indicative of its core operating performance and that may obscure underlying business results, trends, and comparability between periods. Ethanol segment adjusted EBITDA per gallon is Ethanol segment adjusted EBITDA divided by ethanol production volume for the period. Production volume is calculated by multiplying production volumes per day by the number of days in the applicable period.

Capital Investments Attributable to Valero

VLO defines capital investments attributable to Valero as all capital expenditures, deferred turnaround and catalyst cost expenditures, and investments in non-consolidated joint ventures presented in VLO's consolidated statements of cash flows excluding the portion of DGD's capital investments attributable to the other joint venture member and all of the capital expenditures of other VIEs. Capital investments attributable to Valero are allocated between sustaining capital investments attributable to Valero and growth capital investments attributable to Valero.

In general, DGD's members use DGD's operating cash flow (excluding changes in its current assets and current liabilities) to fund its capital investments rather than distribute all of that cash to themselves. Because DGD's operating cash flow is effectively attributable to each member, only 50% of DGD's capital investments should be attributed to VLO's net share of capital investments. VLO also excludes the capital expenditures of other consolidated VIEs because VLO does not operate those VIEs. VLO believes that capital investments attributable to Valero is an important measure because it more accurately reflects capital investments of VLO.

Non-GAAP disclosures

Adjusted Net Cash Provided by Operating Activities

VLO defines adjusted net cash provided by operating activities as net cash provided by operating activities excluding the items noted below. VLO believes adjusted net cash provided by operating activities is an important measure of its ongoing financial performance to better assess its ability to generate cash to fund VLO's investing and financing activities. The basis for VLO's belief with respect to each excluded item is provided below.

- Changes in current assets and current liabilities – Current assets net of current liabilities represents VLO's operating liquidity. VLO believes that the change in its operating liquidity from period to period does not represent cash generated by VLO's operations that is available to fund VLO's investing and financing activities.
- DGD's adjusted net cash provided by operating activities attributable to the other joint venture member's ownership interest in DGD – VLO is a 50% joint venture member in DGD and consolidates DGD's financial statements; as a result, all of DGD's net cash provided by operating activities (or operating cash flow) is included in VLO's consolidated net cash provided by operating activities. In general, DGD's members use DGD's operating cash flow (excluding changes in its current assets and current liabilities) to fund its capital investments rather than distribute all of that cash to themselves. Nevertheless, DGD's operating cash flow is effectively attributable to each member and only a portion of DGD's operating cash flow should be attributed to VLO's net cash provided by operating activities. Therefore, net cash provided by operating activities has been adjusted for the portion of DGD's operating cash flow attributable to the other joint venture member's ownership interest because VLO believes that it more accurately reflects the operating cash flow available to VLO to fund VLO's investing and financing activities.

Return on Invested Capital (ROIC) Including Amounts Attributable to the Other Joint Venture Members

VLO defines ROIC including amounts attributable to the other joint venture members as adjusted net income (loss) before net interest expense after-tax divided by average invested capital. VLO defines adjusted net income (loss) as net income (loss) adjusted for the after-tax effect of special items that VLO believes are not indicative of its core operating performance and that may obscure VLO's underlying business results, trends, and comparability between periods (see corresponding earnings releases). Net income (loss) reflects VLO consolidated earnings prior to the exclusion of net income (loss) attributable to noncontrolling interests. The after-tax effect of special items includes the effect of special items that are attributable to the other joint venture members. The income tax effect of net interest expense is estimated based on the U.S. statutory income tax rate for the respective annual period. Average invested capital is defined as the average of total invested capital for the current and prior annual period. VLO defines total invested capital as total debt and finance lease obligations plus total equity less cash and cash equivalents.

Adjusted Return on Equity (ROE) Attributable to Valero

VLO defines adjusted ROE attributable to Valero as adjusted net income (loss) attributable to VLO stockholders divided by average VLO stockholders' equity. VLO defines adjusted net income (loss) attributable to VLO stockholders as net income (loss) attributable to VLO stockholders adjusted for the after-tax effect of special items attributable to VLO stockholders that VLO believes are not indicative of its core operating performance and that may obscure VLO's underlying business results, trends and comparability between periods (see corresponding earnings releases). Average VLO stockholders' equity is defined as the average of total VLO stockholders' equity for the current and prior annual period. VLO stockholders' equity reflects total stockholders' equity prior to the inclusion of equity attributable to noncontrolling interests.

Non-GAAP disclosures

DGD Adjusted EBITDA per Gallon

DGD adjusted EBITDA is defined as DGD's operating income excluding depreciation and amortization expense, adjusted for the effect of items that VLO believes are not indicative of DGD's core operating performance and that may obscure underlying business results, trends, and comparability between periods. DGD adjusted EBITDA per gallon is DGD adjusted EBITDA divided by DGD's sales volume for the period. Sales volume is calculated by multiplying sales volumes per day by the number of days in the applicable period.

Adjusted EBITDA

VLO defines EBITDA as net income (loss) before depreciation and amortization expense, "interest and debt expense, net of capitalized interest", income tax expense (benefit), and income (loss) from discontinued operations. VLO defines adjusted EBITDA as EBITDA further adjusted for the effect of special items that VLO believes are not indicative of its core operating performance and that may obscure VLO's underlying business results and trends. VLO believes that the presentation of adjusted EBITDA provides useful information to investors to assess its ongoing financial performance because when reconciled to net income, it provides improved comparability between periods. The U.S. GAAP measures most directly comparable to adjusted EBITDA are net income and net cash provided by operating activities.
